

## AST101 – Astronomy of the Solar System at [Suffolk County Community College, NY](#)

### Catalog Description:

Introduction to fundamental aspects of planetary science. Topics include historical development of astronomy; basic concepts of celestial coordinates and motions; properties and individual characteristics of planets and their moons, asteroids, comets and meteoroids; and origin and evolution of the solar system. Students also learn to identify celestial objects (constellations, prominent stars, planets, etc.) utilizing planetarium, telescopes and unaided eye. Occasional evening observations required. Note: Fulfills [SUNY-GE](#) Natural Sciences. (3 hrs. lecture, 2 hrs. laboratory) Prerequisite: [MAT007](#) (Algebra I) or equivalent. Offered on: A-E-G / 4 cr. hrs.

### **Learning Outcomes:**

Upon completion of this course, students will be able to:

1. Use measurements and astronomical data to describe the solar system.
2. Summarize how the scientific method applies to astronomy.
3. Use the horizon system to locate prominent stars and constellations.
4. Compare the fundamental properties of planets to Earth and each other.
5. Evaluate the Sun's influence on the planets of the solar system.
6. Relate the properties of the solar system to the solar nebula theory.
7. Discuss recent developments in the field of astronomy.

Because of the basic algebra math prerequisite, AST101 is transferable as a general science elective to astronomy-major programs at 4-year institutions, and not as a major-specific course (there are few exceptions). Most AST101 students take the class to satisfy a science requirement to graduate with an associate degree. For most students, it is the first and only science class they take in college.

## AST102 – Astronomy of Stars and Galaxies at [Suffolk County Community College, NY](#)

### [Catalog Description:](#)

Introduction to fundamental aspects of universe beyond our solar system. Topics include properties of electromagnetic radiation and its relation to study of celestial objects; structure, classification and evolution of stars, nebulae, star clusters, galaxies, and material between stars. Age, origin and evolution of universe studied in terms of modern cosmology. Occasional evening observations required. Note: Fulfills SUNY-GE Natural Sciences. (3 hrs. lecture, 2 hrs. laboratory.) Prerequisite: [MAT007](#) (Algebra I) or equivalent. Offered on: A-E-G / 4 cr. hrs.

### Learning Outcomes:

Upon completion of this course, students will be able to:

1. Use measurements and astronomical data to describe the universe.
2. Summarize how the scientific method applies to astronomy.
3. Explain how the properties of light are used to obtain information about the universe.
4. Compare the fundamental properties of stars to the Sun and each other.
5. Describe the structure of the Sun.
6. Trace the evolution of stars from birth to death.
7. Compare the fundamental properties of galaxies to the Milky Way and each other.
8. Describe the past and future evolution the universe.
9. Discuss recent developments in the field of astronomy.

Because of the basic algebra math prerequisite, AST102 is transferable as a general science elective to astronomy-major programs at 4-year institutions, and not as a major-specific course (there are few exceptions). Most AST102 students take the class to satisfy a science requirement to graduate with an associate degree. For most students, it is the first and only science class they take in college. Students can choose to take AST101 or AST102, no matter the order.
